Open Shortest Path First (OSPF)
is a link-state routing protocol,
rather than a distance vector
protocol. The main difference here

Access Free Ospf A Network Routing Protocol

is that a linked-state protocol does not send its routing table in the form of updates, but only shared its connectivity configuration. By collecting connectivity information from all of the devices on the network, OSPF can store all this information in a database and use

OSPF is a link-state routing
protocol, as we ' ve said. Think of
this as a distributed map of the
network. To get this information

distributed, OSPF does three things. First, when a router running OSPF comes up it will send hello packets to discover its neighbors and elect a designated router.

OSPF (Open Shortest Path First)

OSPF is a standardized Link-State

routing protocol, designed to scale efficiently to support larger networks. OSPF adheres to the following Link State characteristics:

- OSPF employs a hierarchical network design using Areas.
- OSPF will form neighborrelationships with

adjacent routers in the same Area.

OSPF is a routing protocol. Two routers speaking OSPF to each other exchange information about the routes they know about and the cost for them to get there.

When many OSPF routers are part

of the same network, information about all of the routes in a network are learned by all of the OSPF routers within that network—technically called an area.
