In probability theory and statistics, a Gaussian process is a stochastic process, such that every finite collection of those random variables has a multivariate normal distribution, i.e. every finite linear combination of them is normally distributed. The distribution of a Gaussian process is the joint distribution of all those random variables, and as such, it is a distribution over functions with a continuous domain, e.g. time or space. A machine-learning algorithm that involves a Gaussian pro

The utilization of the Gaussian random field to model spatially dependent uncertainties is commonly practiced in the context of stochastic analysis. However, due to the possibility of Gaussian random field may have a negative value, the Gaussian random fields are not totally suitable for modelling material properties (e.g. Young's modulus, Poisson's ratio) of engineering structures.

A Gaussian random field (GRF) is a random field involving Gaussian probability density functions of the variables. A one-dimensional GRF is also called a Gaussian process.An important special case of a GRF is the Gaussian free field.. With regard to applications of GRFs, the initial conditions of physical cosmology generated by quantum mechanical fluctuations during cosmic inflation are ...

Because the wave environment is inherently random, it is necessary to model the airgap as a stochastic process and carry out a statistical analysis to evaluate the extreme value. For time domain simulation or model tests, the statistical analysis involves post-processing the time histories of the simulated or measured airgap response.

In physics and mathematics, a random field is a random function over an arbitrary domain (usually a multi-dimensional space such as).That is, it is a function () that takes on a random value at each point E (or some other domain). It is also sometimes thought of as a synonym for a stochastic process with some restriction on its index set. That is, by modern definitions, a random field is a ...
