Pythagoras Theorem (Formula, Proof and Examples)

The Pythagorean Theorem is a generalization of the Cosine Law, which states that in any triangle: $c^2 = a^2 + b^2 - 2(a)(b)(\cos(C))$, where C is the angle opposite side c. In a right triangle, where a and b are the legs, and c is the hypotenuse, we have (because the right angle is opposite the hypotenuse): $c^2 = a^2 + b^2 - 2(a)(b)(\cos(90))$.

Pythagoras' theorem: In a right-angled triangle, the square of the hypotenuse is equal to the sum of the squares of the other two sides. Procedure. Step 1: Paste a sheet of white paper on the cardboard. On this paper, draw a right-angled triangle ABC, right angled at C.

Substitute values into the formula (remember 'C' is the hypotenuse).

$$A^2 + B^2 = C^2 \quad 9^2 + x^2 = 10^2$$

Next step. Step 3. Solve for the unknown. $9^2 + x^2 = 10^2$

$$81 + x^2 = 100 \quad x^2 = 100 - 81$$

$$x^2 = 19 \quad x = \sqrt{19} \approx 4.4$$

Problem 3. Use the Pythagorean theorem to calculate the value of X. Round your answer to the nearest hundredth.

Although it was previously used by the Indians and Babylonians, Pythagoras (or his students) were credited to be the first to prove the theorem. It should be noted that there is no concrete evidence that Pythagoras himself worked on or proved this theorem.

The Pythagoras theorem, also known as the Pythagorean theorem, states that the square of the length of the hypotenuse is equal to the sum of squares of the lengths of other two sides of the right-angled triangle. Or, the sum of the squares of the two legs of a right triangle is equal to the square of its hypotenuse.

In mathematics, the Pythagorean theorem, also known as Pythagoras's theorem, is a fundamental relation in Euclidean geometry among the three sides of a right triangle. It states that the area of the square whose side is the hypotenuse (the side opposite the right angle) is equal to the sum of the areas of the squares on the other two sides.
